Let $(M; \nabla)$ be a two dimensional affine manifold and $(T * M, g^\nabla)$ its Riemannian extension. In this paper, we show that $(T * M, g^\nabla)$ has a cyclic parallel Ricci tensor (or is an L_3 -space or is a A-manifold Einstein-like) if and only if $(M; \nabla)$ has a cyclic parallel Ricci tensor (or is an L_3 -space or is a A-manifold Einstein-like).

Keywords: Ricci tensor, Cyclic parallel Ricci tensor, affine surface, Riemann extensions.
